Subject: We beat the telecoms in California!

Together, we did it!

Yesterday, California Governor Newsom **vetoed** SB 556, a telecom-sponsored bill that would have paved the way for the rapid and unchecked deployment of small cell antennas across California.

The bill was supported by all the wireless carriers, big business groups and people who believed the big lie that wireless broadband is the answer to closing the digital divide.

Congratulations to all of the individuals and groups in California and across the country who signed petitions, sent letters and emails to legislators, newspapers and the Governor, participated in the Twitter storm and who always believed that we could win. We are proud to have played a part in this great success!

Thank you :-)

- The ART Team

But...the fight may not be over yet. We expect the telecoms and their legislative supporters to try to mount an override of the Governor's veto. Please watch your inbox for news and information from ART and be ready to help us fight once more.

Is your local small cell code up to date?

Now that California's governor has preserved the right for local officials to decide how new technologies will be integrated into their communities, it's more important than ever that your local code is up to date.

No matter where you live, your best protection against finding a small cell antenna in your front yard is a strong municipal code.

Our updated Municipal Code Checklist contains some of the most important language that every code should contain. Download a copy today and share with your municipal officials.

Thank you to all of the organizations and individuals who worked with us in California, and also to those around the country whose financial contributions continue to make all of our efforts possible. We are extremely grateful for your support!
